

Engineered Wood Fiber for Dog Parks

Off-leash areas rapidly become the most popular locations within parks. The grass in these areas is quickly loved to death. The lack of grass leads to craters and dirt in the park. Worse, if the grass isn't irrigated, it vanishes even faster.

The same **Fibar® Engineered Wood Fiber** that makes playgrounds and equestrian facilities safer is the solution. Made of specially ground wood fibers, it helps reduce mud puddles, craters, dust and dirt in your dog park.

Fibar Engineered Wood Fiber is made from specially ground virgin wood fibers that have been screened to yield random-sized particles that generally do not exceed ½" x 2" in size. This longer shape, along with the smaller-size particles, aids in the interlocking process to reduce movement and eliminate splinters. Because the long fibers tend to mat down and interlock together, the surface actually improves with age and use to resist movement and absorb impact.

Fibar Engineered Wood Fiber is only made from virgin lumber sources to avoid contaminants and is suitable for use by both children and dogs. Fibar Engineered Wood Fiber is ADA accessible and exceeds ASTM F-1951 accessibility requirements.

Fibar Engineered Wood Fiber should be installed at least 6 inches deep (do not use an underlayment or geotextile). Be aware that a certain amount of maintenance will sometimes be needed to maintain a uniform depth.

To estimate the amount of material needed, multiply the square footage of your area by .017. The result is the number of cubic yards required. For help, call us at 800.342.2721, or send a request to info@fibar.com, and we'll do the math.

Fibar Engineered Wood Fiber is delivered on self-unloading, live-floor trucks, to a paved point closest to the dog park that is accessible by a semi-truck up to 70' long.
